Manuscript Revision Summary

1. Main improvements

Area	Before	Now
Research focus	Leather recognition proof of concept.	Defined swatch-ID retrieval and linked the empirical contribution to measured results.
Evaluation	Mainly one leather dataset.	Added Fabric, MatSim and DTD, including a common-query comparison of reference choices.
Comparisons	Limited controls and uneven augmentation settings.	Added appearance controls, shared inputs, nested views and broader adaptation checks.
Consistency	Historical ablation discrepancies and unclear uncertainty.	Separated historical and current results; clarified paired statistics and completed digital stress tests.
Practical evidence	Mostly qualitative deployment discussion.	Measured CPU costs and compared digital views with additional original photographs.
Writing and files	Repetitive framing and less supporting detail.	Strengthened the argument, corrected figure references and verified the editable source build.

2. Progress on the professor's requests

Request	Status	Key point / remaining work
1. Scientific contribution	Partly done	Argument strengthened; transfer across capture conditions remains untested.
2. Data independence / provenance	Partly done	Image roles clarified; capture records still missing.
3. Repeated real-leather photos	Not done	Multiple independent captures per leather identity needed.
4. Class identity / appearance cues	Mostly done	Swatch-ID definition complete; semantic-pair testing remains.
5. Consistent ablations	Partly done	Current controls documented; old random pools not fully recovered.
6. Fair baseline comparisons	Mostly done	Controlled comparisons reported; tuning remains bounded.
7. Statistical reporting	Done	Uncertainty and paired comparisons corrected for the available data.
8. Open-set evaluation	Partly done	Calibration improved; field unknowns still untested.
9. Robustness	Partly done	Digital tests complete; real capture changes untested.
10. Augmentation mechanism	Partly done	Stability measured; physical invariance unproven.
11. External validation	Mostly done	Three external datasets; general transfer still limited.
12. Figures / writing / reproducibility	Mostly done	References and source build checked; independent retraining not repeated.
